# What can we forecast?

# What can we forecast?

# Which is easiest to forecast?

- daily electricity demand in 3 days time
- time of sunrise this day next year
- Google stock price tomorrow
- Google stock price in 6 months time
- maximum temperature tomorrow
- exchange rate of \$US/AUS next week
- total sales of drugs in Australian pharmacies next month
- timing of next Halley's comet appearance

  - 4 daily electricity demand in 3 days time
  - 5 total sales of drugs in Australian pharmacies next month
  - 6 Google stock price tomorrow
  - 7 exchange rate of \$US/AUS next week
  - 8 Google stock price in 6 months time
- how do we measure “easiest”?
  - what makes something easy/difficult to forecast?

# Forecastability factors

Something is easier to forecast if:

- 1 we have a good understanding of the factors that contribute to it
- 2 there is lots of data available;
- 3 the future is somewhat similar to the past
- 4 the forecasts cannot affect the thing we are trying to forecast.

# Outline

- 1 What can we forecast?
- 2 Time series data and random futures
- 3 Some case studies
- 4 Assignment 1

# Time series data

- Four-yearly Olympic winning times
- Annual Google profits
- Quarterly Australian beer production
- Monthly rainfall
- Weekly retail sales
- Daily IBM stock prices
- Hourly electricity demand
- 5-minute freeway traffic counts
- Time-stamped stock transaction data

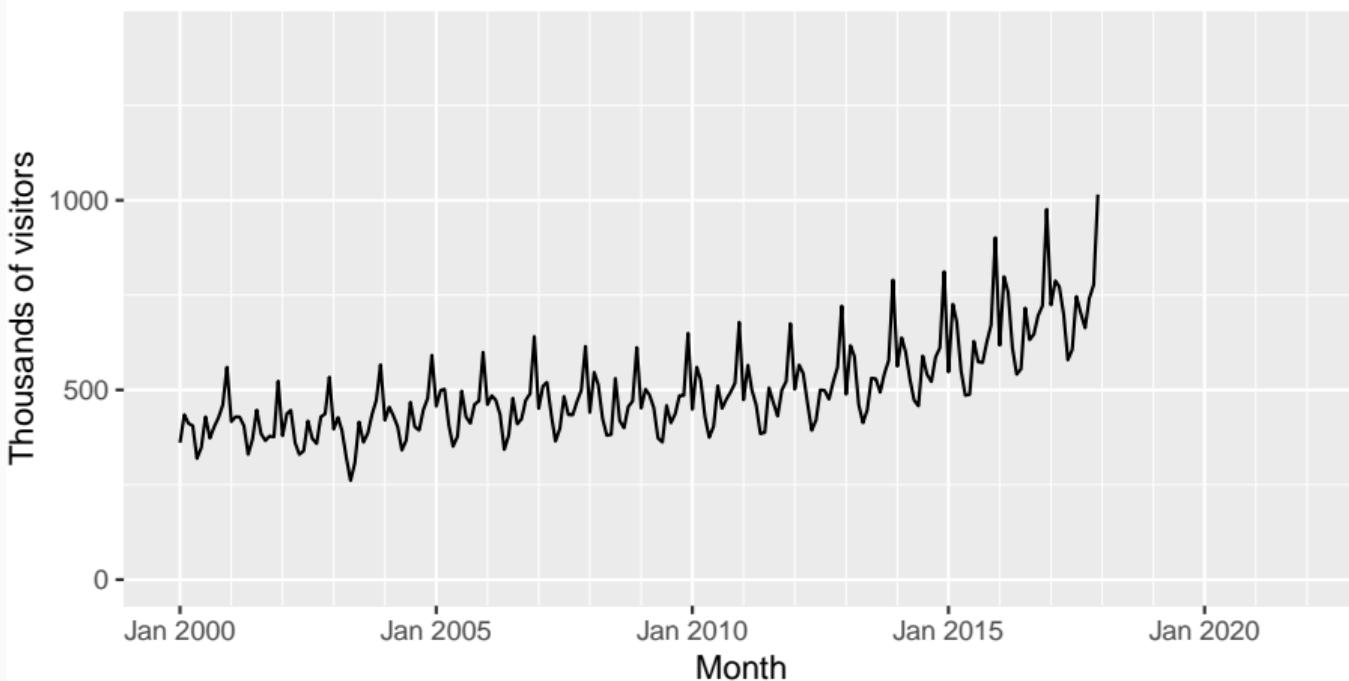

# Random futures

A forecast is an estimate of the probabilities of possible futures.

# Random futures

# Statistical forecasting

- Thing to be forecast: a random variable,  $y_t$ .
- Forecast distribution: If  $\mathcal{I}$  is all observations, then  $y_t|\mathcal{I}$  means “the random variable  $y_t$  given what we know in  $\mathcal{I}$ .
- The “point forecast” is the mean (or median) of  $y_t|\mathcal{I}$
- The “forecast variance” is  $\text{var}[y_t|\mathcal{I}]$
- A prediction interval or “interval forecast” is a range of values of  $y_t$  with high probability.
- With time series,  $y_{t|t-1} = y_t|\{y_1, y_2, \dots, y_{t-1}\}$ .
- $\hat{y}_{T+h|T} = E[y_{T+h}|y_1, \dots, y_T]$  (an  $h$ -step forecast taking account of all observations up to time  $T$ ).

# Outline

- 3 Some case studies
- 4 Assignment 1

# CASE STUDY 1: Paperware company

**Problem:** Want forecasts of each of hundreds of items.

Series can be stationary, trended or seasonal. They currently have a large forecasting program written in-house but it doesn't seem to produce sensible forecasts. They want me to fix it.

## Additional information

- Program written in COBOL making numerical calculations limited. It is not possible to do any optimisation.
- Their programmer has little experience in numerical computing.
- They employ no statisticians and want the program to produce forecasts automatically.

# CASE STUDY 1: Paperware company

## Methods currently used

- A 12 month average
- C 6 month average
- E straight line regression over last 12 months
- G straight line regression over last 6 months
- H average slope between last year's and this year's values.  
(Equivalent to differencing at lag 12 and taking mean.)
- I Same as H except over 6 months.
- K I couldn't understand the explanation.

## CASE STUDY 2: PBS

## CASE STUDY 2: PBS

**The Pharmaceutical Benefits Scheme (PBS) is the Australian government drugs subsidy scheme.**

- Many drugs bought from pharmacies are subsidised to allow more equitable access to modern drugs.
- The cost to government is determined by the number and types of drugs purchased. Currently nearly 1% of GDP.
- The total cost is budgeted based on forecasts of drug usage.

# CASE STUDY 2: PBS

POLITICS

## Opp demands drug price restriction after PBS budget blow-out

The Federal Opposition has called for tighter controls on drug prices after the Pharmaceutical Benefits Scheme (PBS) budget blew out by almost \$800 million.

The money was spent on two new drugs including the controversial anti-smoking aid Zyban, which dropped in price from \$220 to \$22 after it was listed on the PBS.

## CASE STUDY 2: PBS

- In 2001: \$4.5 billion budget, under-forecasted by \$800 million.
- Thousands of products. Seasonal demand.
- Subject to covert marketing, volatile products, uncontrollable expenditure.
- Although monthly data available for 10 years, data are aggregated to annual values, and only the first three years are used in estimating the forecasts.
- All forecasts being done with the FORECAST function in MS-Excel!

## CASE STUDY 3: Car fleet company

**Client:** One of Australia's largest car fleet companies

**Problem:** how to forecast resale value of vehicles? How should this affect leasing and sales policies?

# CASE STUDY 3: Car fleet company

**Client:** One of Australia's largest car fleet companies

**Problem:** how to forecast resale value of vehicles? How should this affect leasing and sales policies?

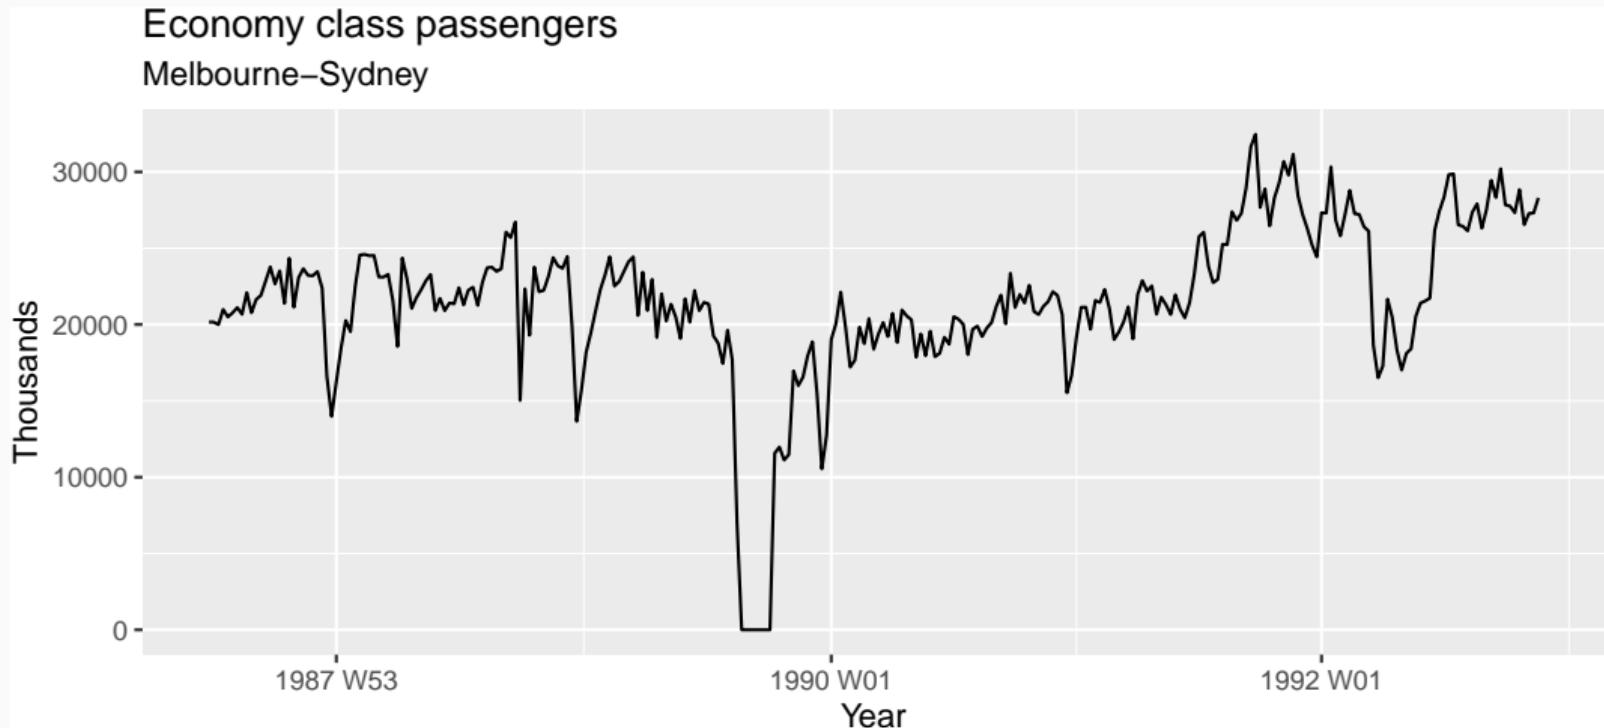

## Additional information

- They can provide a large amount of data on previous vehicles and their eventual resale values.
- The resale values are currently estimated by a group of specialists. They see me as a threat and do not cooperate.

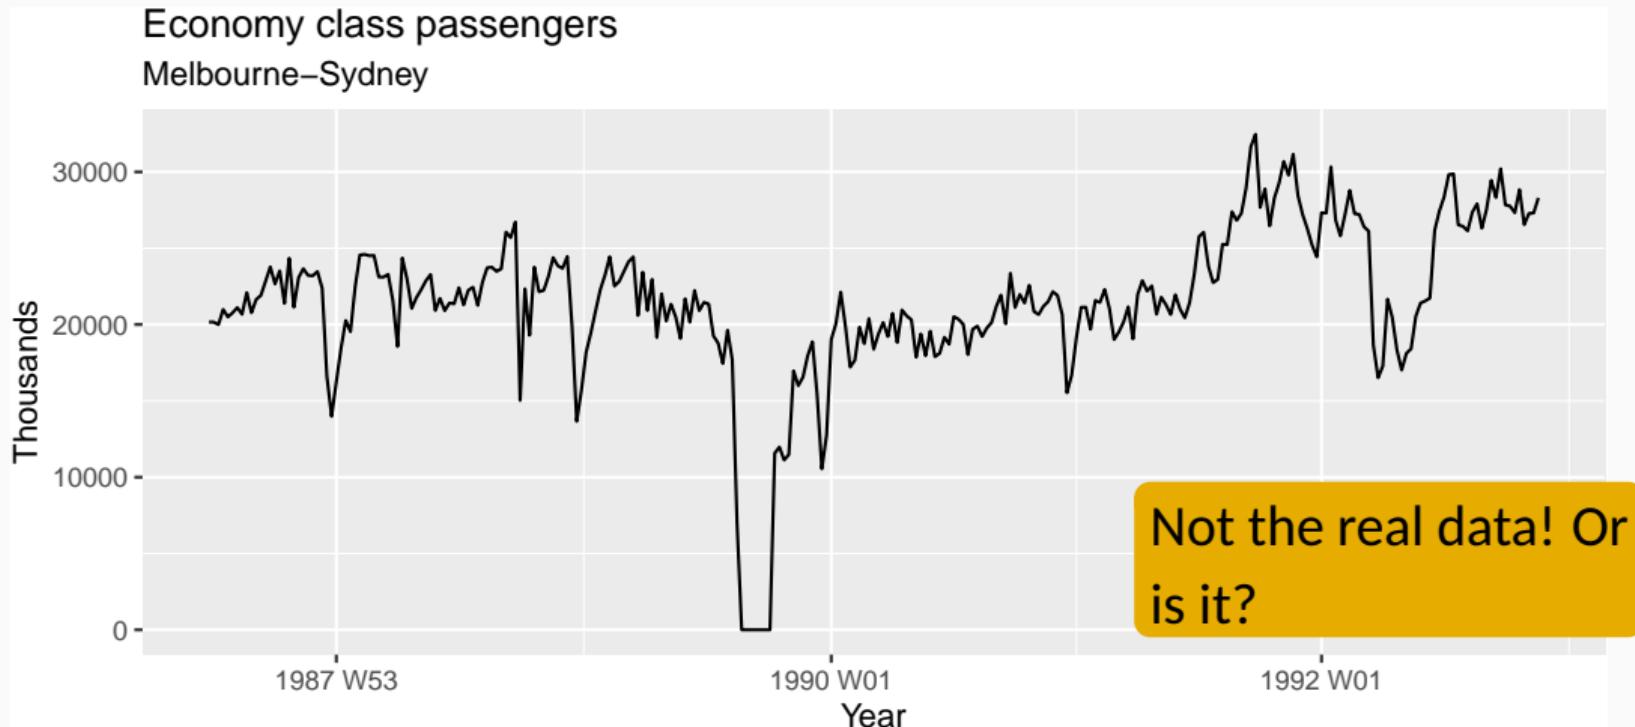

## CASE STUDY 4: Airline

# CASE STUDY 4: Airline

# CASE STUDY 4: Airline

# CASE STUDY 4: Airline

**Problem:** how to forecast passenger traffic on major routes?

## Additional information

- They can provide a large amount of data on previous routes.
- Traffic is affected by school holidays, special events such as the Grand Prix, advertising campaigns, competition behaviour, etc.
- They have a highly capable team of people who are able to do most of the computing.

# Outline

- 1 What can we forecast?
- 2 Time series data and random futures
- 3 Some case studies
- 4 Assignment 1

# Assignment 1: forecast the following series

- 1 Google closing stock price on 21 March 2022.
- 2 Maximum temperature at Melbourne airport on 5 April 2022.
- 3 The difference in points (Collingwood minus Essendon) scored in the AFL match between Collingwood and Essendon for the Anzac Day clash. 25 April 2022.
- 4 The seasonally adjusted estimate of total employment for April 2022. ABS CAT 6202, to be released around mid May 2022.
- 5 Google closing stock price on 23 May 2022.

**Due Sunday 13 March**

For each of these, give a point forecast and an 80% prediction interval.

# Assignment 1: forecast the following series

- 1 Google closing stock price on 21 March 2022.
- 2 Maximum temperature at Melbourne airport on 5 April 2022.
- 3 The difference in points (Collingwood minus Essendon) scored in the AFL match between Collingwood and Essendon for the Anzac Day clash. 25 April 2022.
- 4 The seasonally adjusted estimate of total employment for April 2022. ABS CAT 6202, to be released around mid May 2022.
- 5 Google closing stock price on 23 May 2022.

**Due Sunday 13 March**

For each of these, give a point forecast and an 80% prediction interval.

Prize: \$50 Amazon gift voucher

# Assignment 1: scoring

$Y$  = actual,  $F$  = point forecast,  $[L, U]$  = prediction interval

## Point forecasts:

$$\text{Absolute Error} = |Y - F|$$

- Rank results for all students in class
- Add ranks across all five items

## Prediction intervals:

$$\text{Interval Score} = (U - L) + 10(L - Y)_+ + 10(Y - U)_+$$

- Rank results for all students
- Add ranks across all five items
